

International Finance Discussion Papers: International Capital Flows and the Returns to Safe Assets in the United States, 2003-2007

By Ben S Bernanke

Bibliogov, United States, 2013. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.A broad array of domestic institutional factors--including problems with the originate-to-distribute model for mortgage loans, deteriorating lending standards, deficiencies in risk management, conflicting incentives for the GSEs, and shortcomings of supervision and regulation--were the primary sources of the U.S. housing boom and bust and the associated financial crisis. In addition, the extended rise in U.S. house prices was likely also supported by long-term interest rates (including mortgage rates) that were surprisingly low, given the level of short-term rates and other macro fundamentals--a development that Greenspan (2005) dubbed a conundrum. The global saving glut (GSG) hypothesis (Bernanke, 2005 and 2007) argues that increased capital inflows to the United States from countries in which desired saving greatly exceeded desired investment--including Asian emerging markets and commodity exporters--were an important reason that U.S. longer-term interest rates during this period were lower than expected.
